Activity Title: "Restuarant System"

1. System Description

The Smart Food Ordering System is a digital platform designed to streamline how customers order meals from a restaurant. It allows users to browse a digital menu, customize their food choices, and place orders through a secure interface. The system handles everything from order placement to payment processing and real-time status tracking. On the administrative side, the system provides tools for restaurant staff to manage their food inventory and update the menu. It also helps managers track daily sales and generate performance reports to improve operational efficiency.

2. System Component

Actors/Users

Customer: The primary user who browses the menu, places orders, and makes payments.

Restaurant Manager (Admin): Manages the food menu, monitors system performance, and views reports. **Chef/Kitchen Staff:** Receives orders and updates the status when food is ready.

Main System Functions **Menu Browsing:** Search and view food items with prices and descriptions. **Order Placement:**

Add items to a cart and confirm a purchase. **Payment Gateway:** Process transactions via credit card or digital wallets. **Menu Management:** Add, remove, or edit food items and prices (Manager only).

3. Short Explanation

This Use Case Diagram represents the high-level functionalities of a Food Ordering System and the interactions between different users. It clearly defines that while a customer handles the purchasing process, the Manager and Chef manage the backend operations like inventory and food preparation. By showing these relationships, the diagram provides a clear roadmap for system logic and ensures all user requirements are met.
